

ABM UTILITIES

C.S. Packages is an authorised ABM developer which allows us to tailor ABM to users requirements. This includes interfaces to other products as well as reporting which is prodommately done using Seagate Crystal Reports.

Utilities Available:

- Kit Import.
- EDI Invoices.
- EDI Orders.
- Inventory Budget Maintenance
- CS Assets Management Software
- Autobuild using AMS Bills
- Consolidation
- Customised Reports

Kit Import Utility

This utility allows kits to be imported and created from Excel spreadsheets into ABM based on a preset format. The spreadsheets are used for quotes and accepted quotes are then automatically added to stock.

EDI Invoices Utility

This utility sends invoices as XML files via FTP to an FTP site.

When a sales invoice is processed to a customer, the invoice is placed in a queue for release.

The release invoices process is run periodically and all invoices or a selection of invoices can then be sent to the customer. Once the invoice files are sent in XML file format, these files are copied to a SENT folder to ensure they are not transmitted more than once.

EDI Orders Utility

This utility sends order confirmations via FTP to an FTP site and monitors invoice confirmations on the FTP site and creates invoices from these.

Inventory Budget Maintenance Utility

This utility allows budgets to be maintained for each sales rep by product group. Comparison reports are also available to analyse the budget to actual sales.

CS Assets Management

CS Assets is a tool which provides you with comprehensive tracking of all assets within your companies. Simple yet flexible are the basic concepts of the package to allow you to free up your time for other tasks.

C.S. PACKAGES

Autobuild using AMS Bills

The Autobuild does automatic production runs using AMS Bills (AMS MUST be purchased for this to run).

- Searches for sales invoices (or Deliveries) not yet processed
- Looks for any item on the invoice that has an AMS Bill and does the production run for products down to raw materials.
- Items are put back into stock to cover the Negative wastage (conversions/alternatives)
- Splits the total production cost across the Raw material P & L accounts which gives a breakdown of production in the GL by ABM product group.
- AMS production runs are no longer required
- Autobuild is run via Actions daily but it is designed to run as a scheduled process if required

Consolidation

This utility allows multiple ABM databases to create and update a centralized consolidated set of general ledger accounts.

Comprehensive Reports Designed

C.S. Packages designs and customizes reports by using Seagate crystal Reports for a variety of situations. There are a large number of reports available.
